Papertrail demonstration reading

Original fictional material for integration testing.

Project: Cedar classroom reading pilot

The pilot identifier is CEDAR-QX17.

The pilot enrolled 37 students in two reading sessions.

This identifier and count are synthetic facts in this local PDF.

They are not results from a real educational study.

Method: a tool-assisted reading workflow

The assistant first lists available PDF documents.

It searches a local SQLite page index for relevant keywords.

It then reads the original page text and cites physical page numbers.

Function calling bridges the language model and local tools.

The model chooses tool names and structured JSON arguments.

The application validates arguments before executing a tool.

Limitations and evaluation

Scanned image PDFs require OCR before text extraction.

Keyword search can miss synonyms and complex semantic relations.

A page citation establishes provenance, not factual entailment.

No improvement in learning outcomes was measured in this fictional pilot.

The reading assistant should abstain when the evidence is missing.

Evaluation should include valid citations and unsupported questions.
